Megan C. Leftwich

Professor of Mechanical and Aerospace Engineering
Faculty Director of the Center of Women in Engineering
The School of Engineering and Applied Science
George Washington University

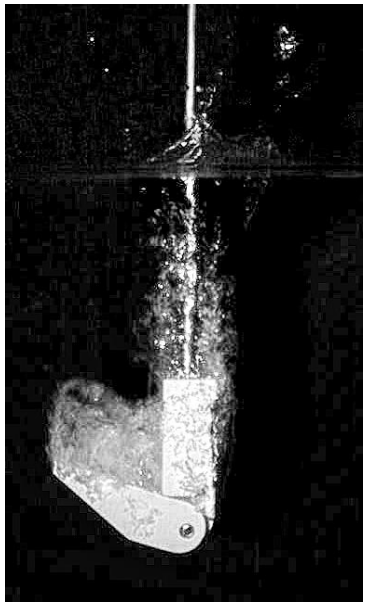

Fluid dynamics inspired by the living world

Fluid dynamics of human birth

The science of diving

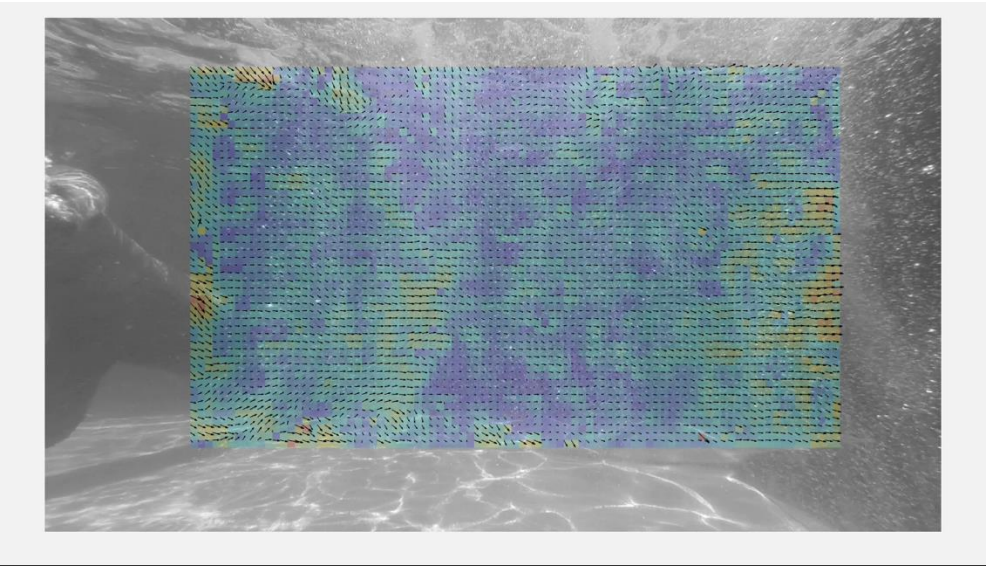

Marine mammal swimming

Sea lion locomotion: from biology to robotics

Swimming

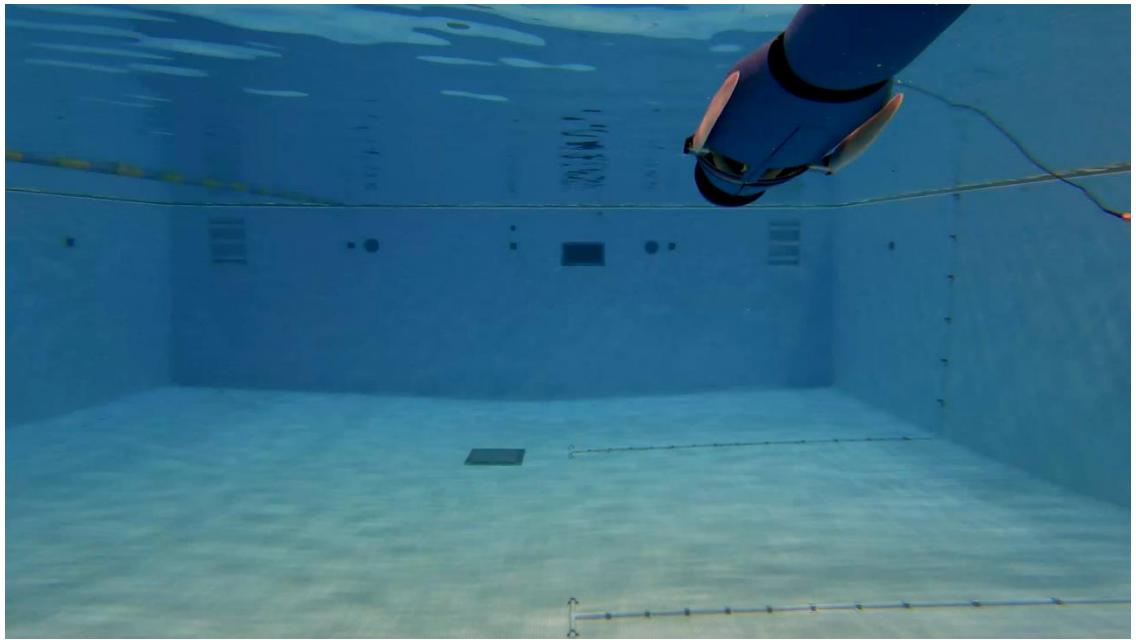

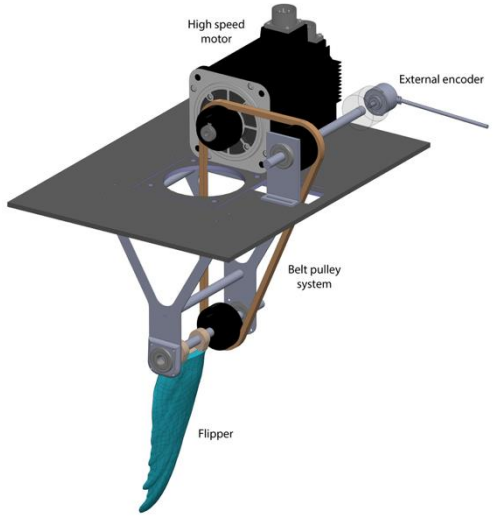

Walking

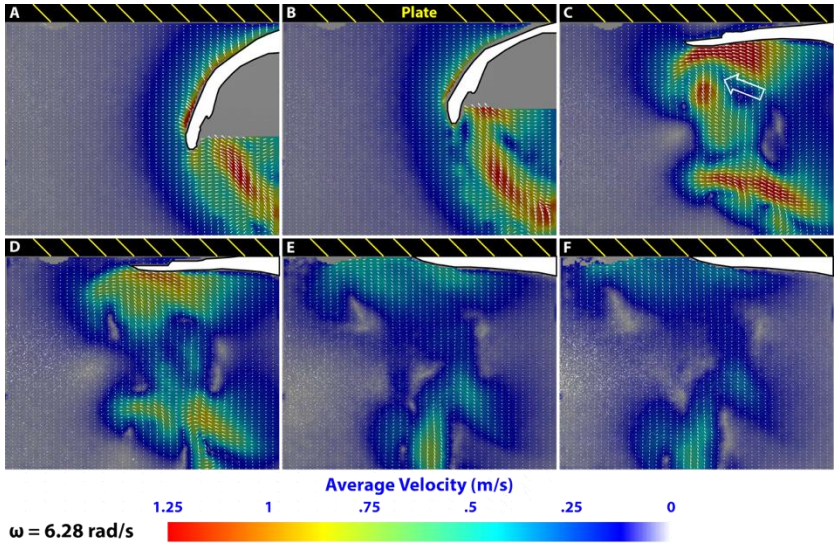

Robotics

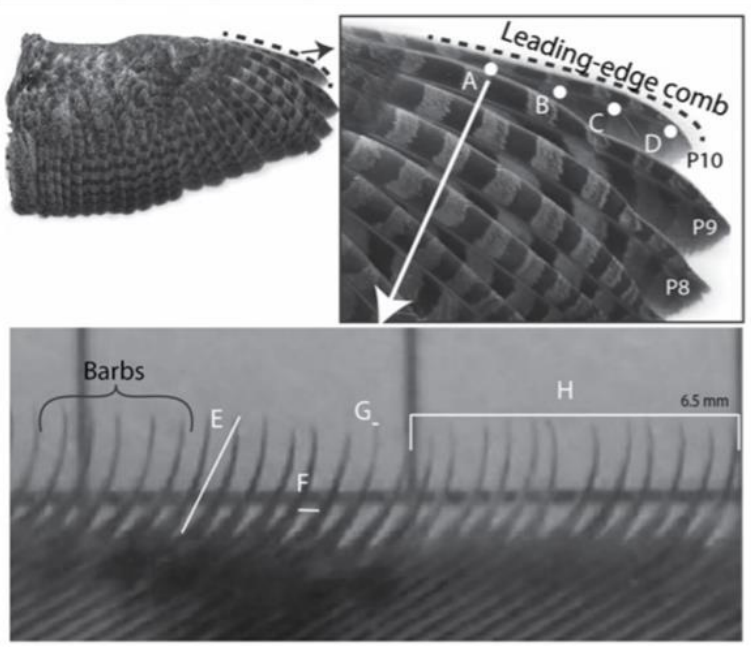

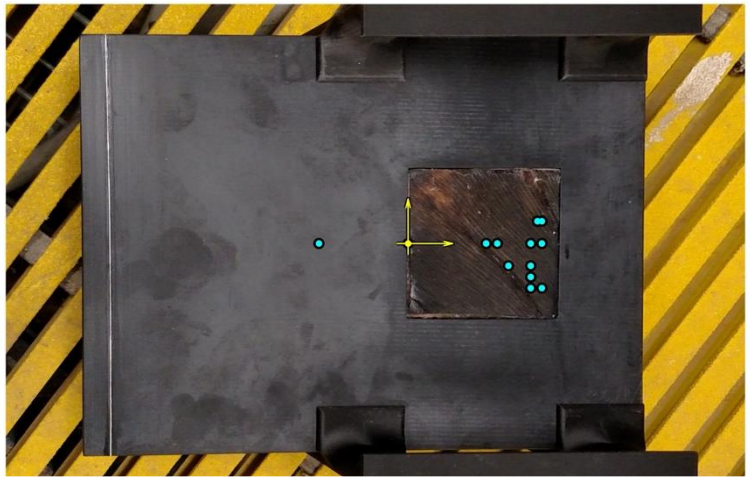

Hydrodynamically Quiet Materials

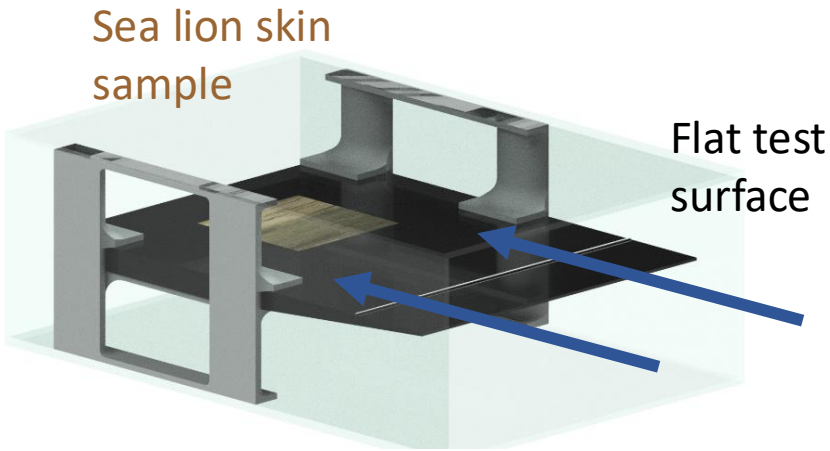

Natural materials perform lots of functions that help varied species survive in fluid environments. Some animals have evolved surfaces that work to manipulate the boundary layer either actively or passively.

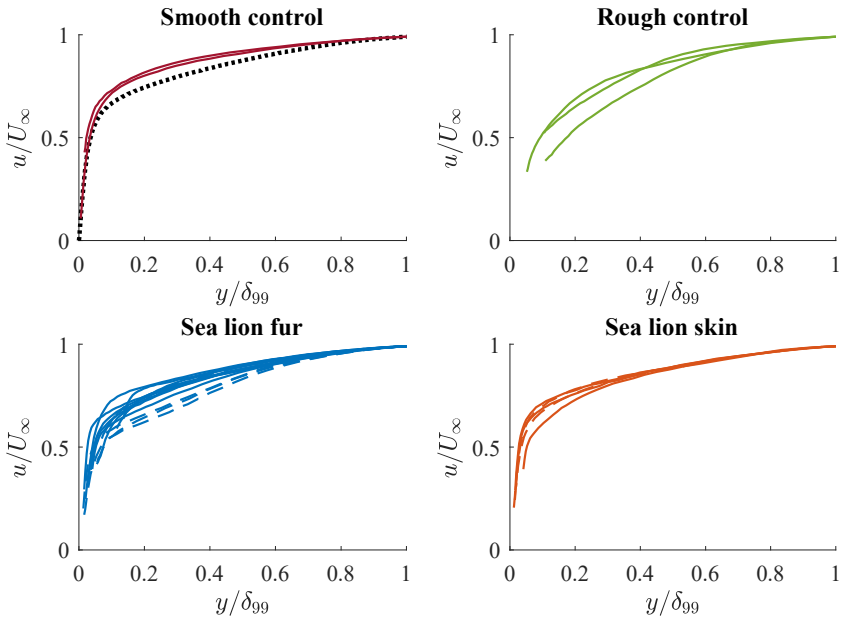

Passive, biological structures can be used to manipulate the fluid-solid interface based on the application.
